

Deep-sea Ecosystem Study - Research Unit Ifremer

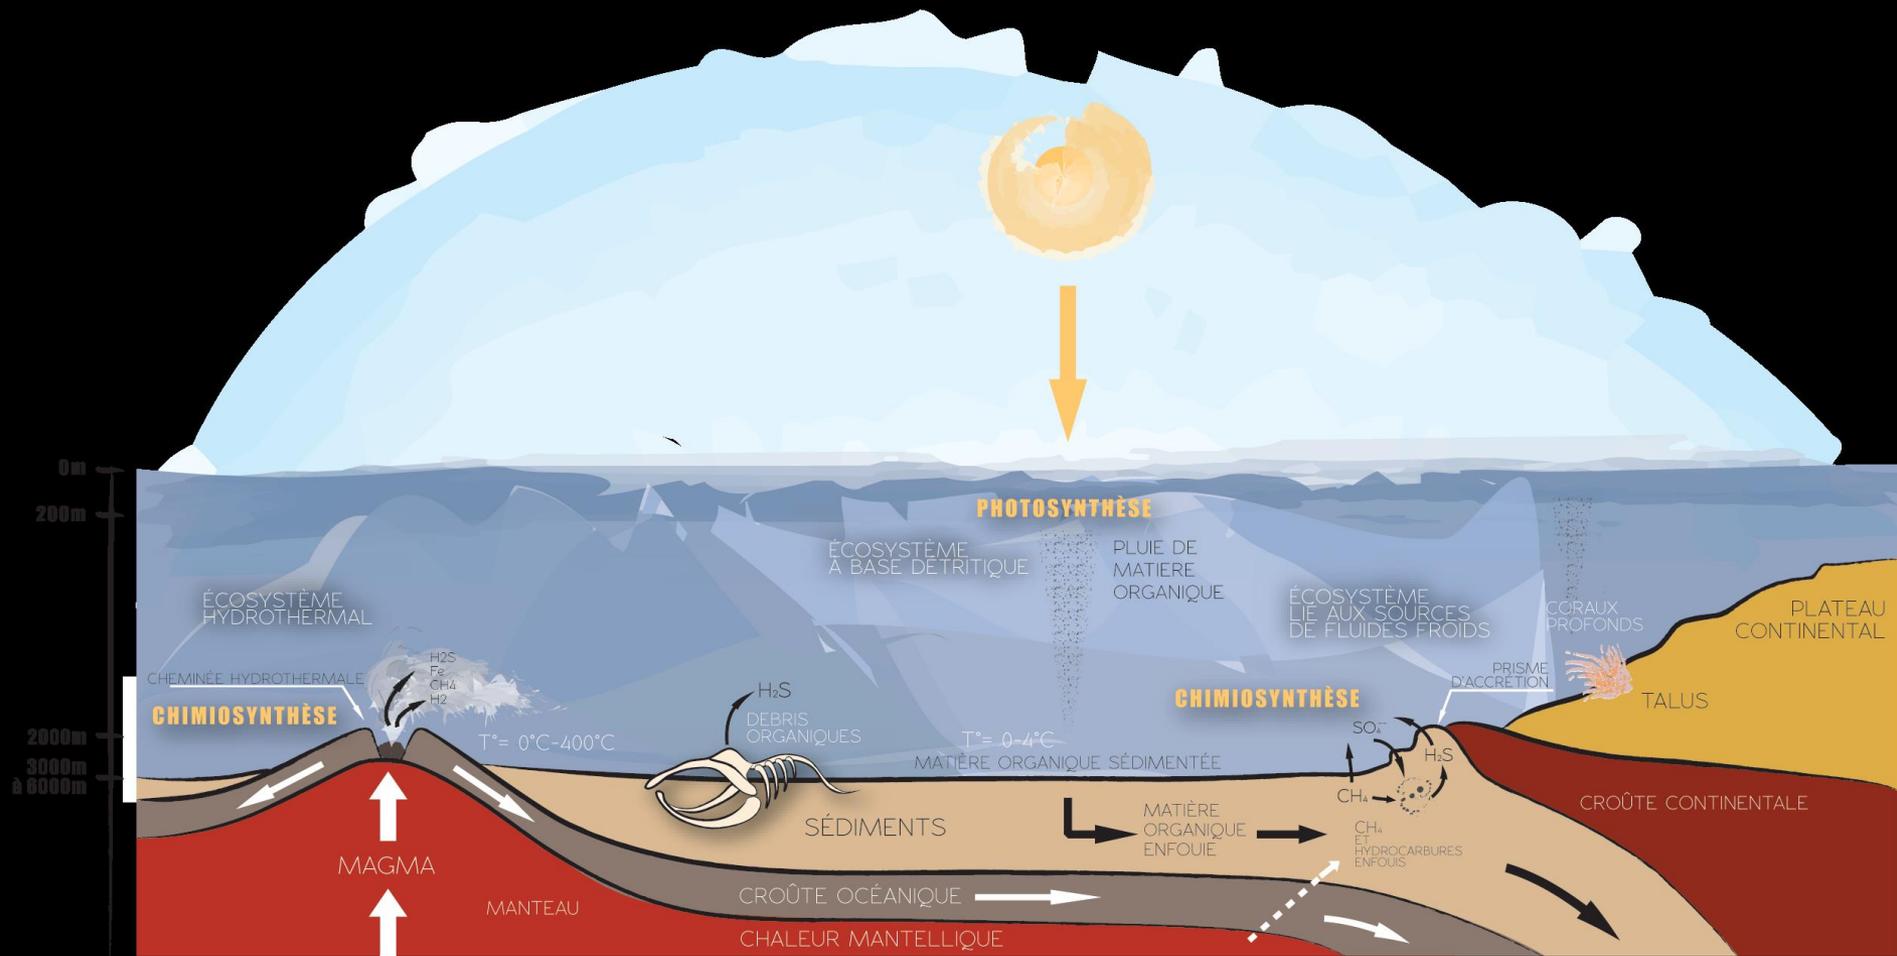

Pierre-Marie Sarradin

Describe and understand the composition, structure and functioning of deep-sea ecosystems

- Biodiversity patterns (including the microbial compartment)
- Structuration by the environment
- Ecosystem functioning (trophic chain, colonisation and life cycle, connectivity, ...)
- Temporal dynamics

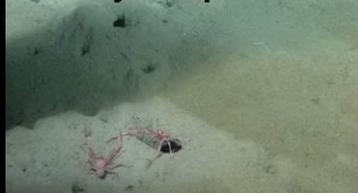

Diversity of deep sea benthic ecosystems

Hydrothermal vents

Abyssal plains

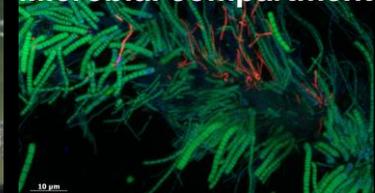

Cold seeps

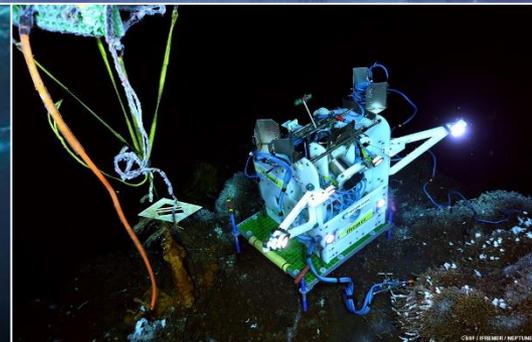

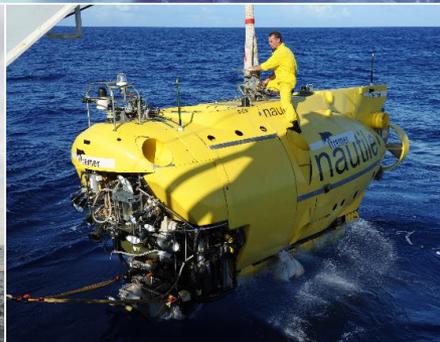

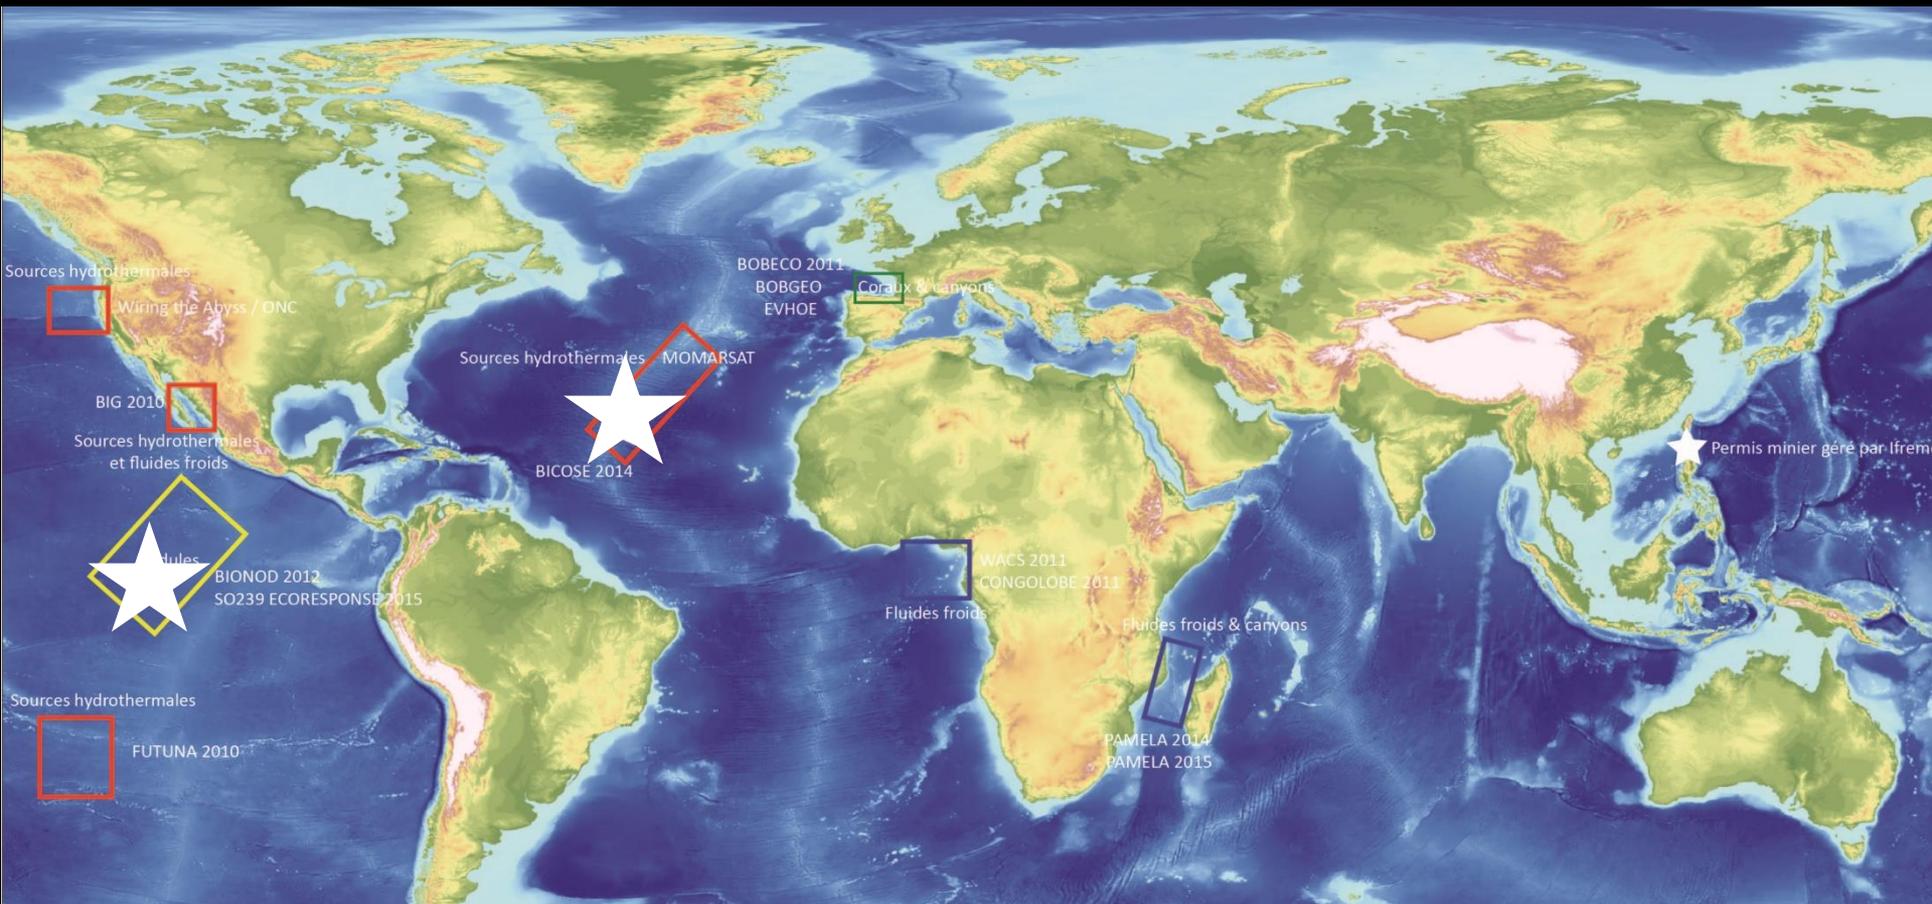

Deep corals

Microbial compartment

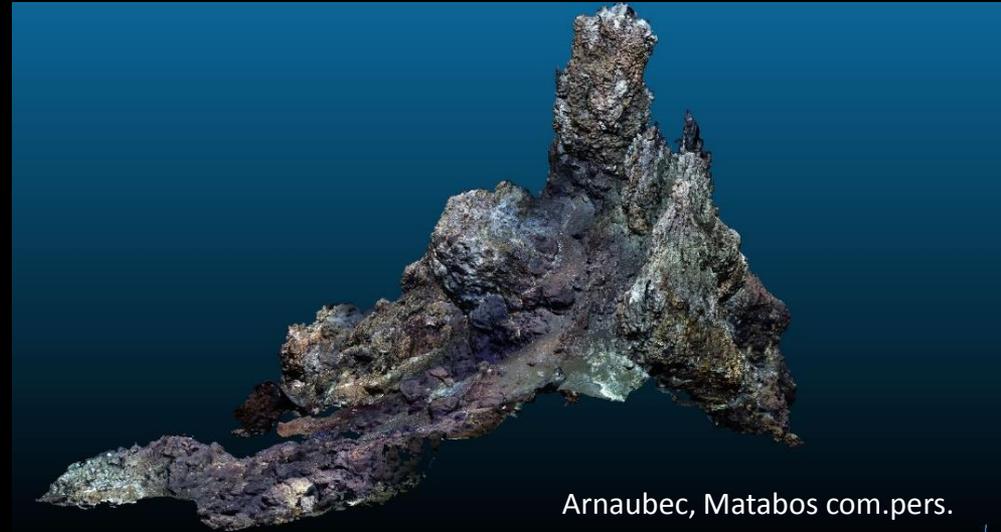

The playing fields

Highlight 1 – Assessing biodiversity

Lucky Strike hydrothermal vent - MPA

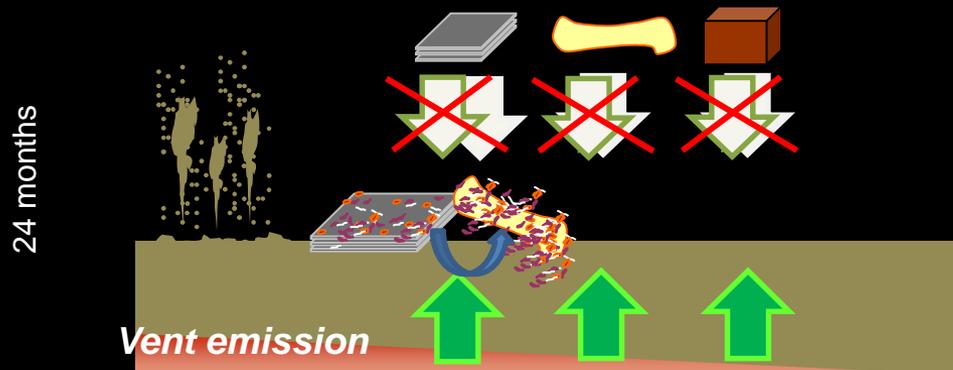

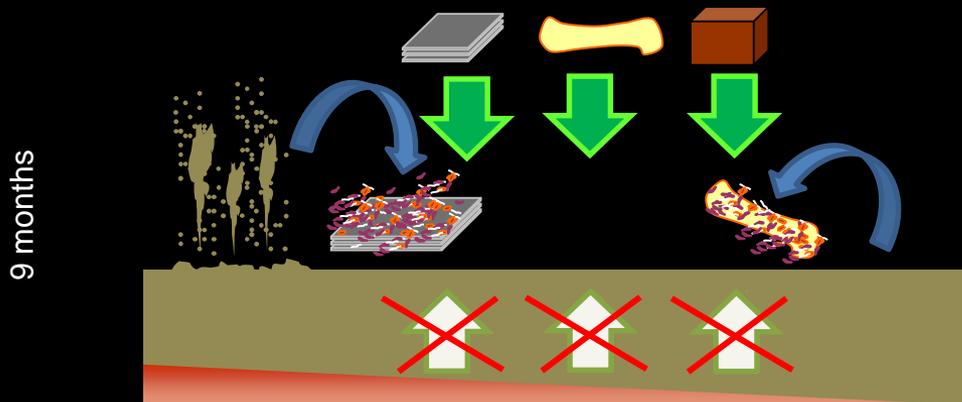

Distribution of macro- and meiofaunal species
70 taxonomic groups identified
39% of "rare" species
20 taxa in 2000 (Van dover)
48 taxa in 2011 (Fabri et al)

Assessing biodiversity is not trivial !

Highlight 2 – Colonisation processes

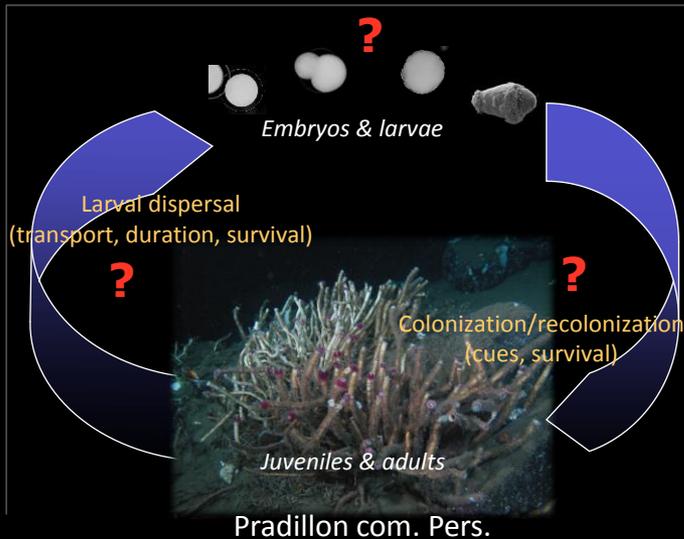

Lucky Strike hydrothermal vent

- Substrate to environmental control of the colonization process (faunal composition)
- Resilience of the ecosystem, recolonisation dynamics

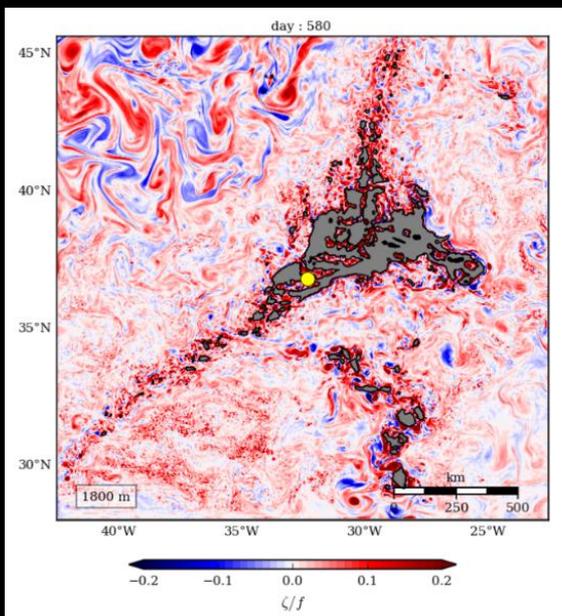

Experimental work and site studies

Key scientific questions

Environmental studies

- Biodiversity patterns in the deep-sea
 - Habitat mapping
 - Ecosystem functioning – life cycle, colonisation,
 - Connectivity
 - Role of deep-ocean circulation in transporting material
-
- New approaches : experimentation and modelisation
 - Resilience
 - Impact assessment

Roulet & Gulla, com. Pers.

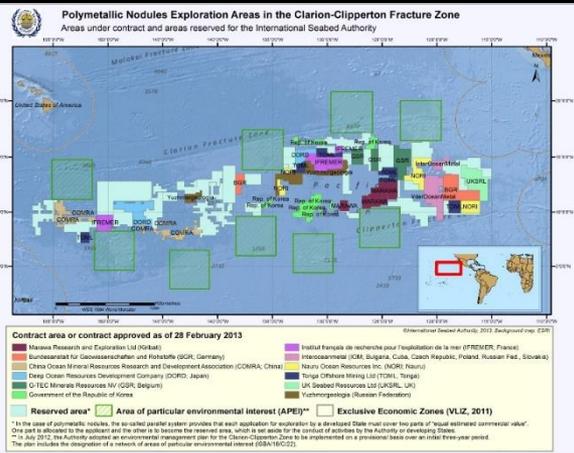

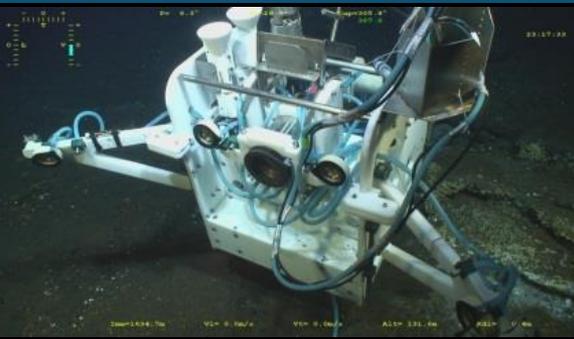

Delving Deeper

How can we achieve sustainable management of our deep sea through integrated research?

MIDAS

MANAGING IMPACTS OF DEEP SEA RESOURCE EXPLOITATION

The role of public investment

Support the acquisition of fundamental knowledge

Exploration

Deep sea ecosystem functioning, ...

Sharing environmental data

From fundamental knowledge to impact assessment and governance

Connecting the deep-sea with society

Social science, legal and economic research

Thank you !
